L49 ANSWER 30 OF 94 MEDLINE on STN

AB OBJECTIVES: to compare the inflammatory response following endovascular and conventional AAA repair. Design: prospective study. PATIENTS AND METHODS: ten patients were selected for open surgery (OPEN) and ten for endovascular (ENDO) AAA repair. Leukocytes, platelets, myeloperoxidase, lactoferrin, beta-thromboglobulin, C-reactive protein (CRP), interleukin 6 (IL-6), tumour necrosis factor alpha (TNF-alpha) and complement activation products were measured before, during and after surgery. RESULTS: in the OPEN group the median hospital stay was longer (6 vs. 12 days, p=0.001) and more patients required transfusion (p=0.02). IL-6 and CRP increased postoperatively, most in OPEN (p<0.01). Platelet counts decreased after the first angiography in ENDO (p<0.01) and before aortic cross-clamping in OPEN (p<0.05). The decrease was larger in OPEN (p=0.02). Leukocyte counts decreased after the first angiography in ENDO, and thereafter increased (p=0.001). An equivalent increase was observed in OPEN after declamping (p=0.001). Leukocyte and platelet degranulation products increased after the first angiography in ENDO and after declamping in OPEN. Changes in complement activation products were small. TNF-alpha did not change significantly. CONCLUSION: endovascular AAA repair caused significant leukocyte and platelet activation. Based on the timing of activation this could be caused by radiographic contrast media. Copyright 2000 Harcourt Publishers Ltd.

AB PURPOSE: Lactoferrin supplementation suppresses ultraviolet light B (UV-B)-induced oxidation of cultures of human corneal epithelial cells. To investigate the protective effect of lactoferrin containing eyedrops against UV-B-induced corneal damage in vivo, we examined lactoferrin efficacy in a rat UV-B keratitis model. METHODS: Sprague-Dawley rats were irradiated with >10 kJ/m2 after anesthetization, and then corneal epithelial defect was observed at 24 h postirradiation. The pre- or postapplication of vehicle or lactoferrin-containing eyedrops was performed, and then corneal epithelial damage was scored based on fluorescein staining. RESULTS: Posttreatment with lactoferrin did not inhibit the extent of corneal damage and did not affect wound healing.

However, pretreatment by topical application of lactoferrin suppressed development of a corneal epithelial defect induced by UV-B irradiation in rats. CONCLUSION: These results suggest that the presence of lactoferrin in human tear fluid may inhibit UV-induced corneal epithelial damage.

AB Inflammation is regulated by the expression of mediators that cause a number of pleiotropic events culminating in the recruitment of inflammatory cells and release of biologic mediators by leukocytes. If the inflammation is transient in nature, it can protect the host by activating defense mechanisms and initiating wound repair. However, if the inflammation is inappropriate, it can lead to considerable tissue damage. My colleagues and I have investigated the role of chemokines, particularly monocyte chemoattractant protein 1, in various pathological processes and the role of the proinflammatory cytokines interleukin-1 (IL-1) and tumor necrosis factor (TNF) in experimental periodontitis. I will discuss first the studies on chemokines and then the use of IL-1 and TNF blockers in inhibiting inflammation and bone loss in the periodontium.

AB The impact of lipoxin A(4) (LXA(4)) and aspirin-triggered-lipoxins (ATL) was investigated in tumor necrosis factor (TNF alpha)-initiated neutrophil (PMN) responses in vitro and in vivo using LX analogs that are metabolically more stable. At nanomolar levels, the LXA(4) and ATL analog 15 R/S-methyl-LXA(4) each blocked TNF alpha-stimulated IL-1 beta release by isolated human PMN in vitro. These LXA(4)-ATL actions were time- and concentration-dependent. The TNF alpha-induced IL-1 beta gene expression was also regulated by 15 R/S-methyl-LXA(4). In addition, 15 R/S-methyl-LXA(4) added to murine air pouches dramatically inhibited TNF alpha-stimulated leukocyte trafficking in vivo, as well as altered the appearance of both macrophage inflammatory peptide-2 and IL-1 beta and concomitantly stimulated IL-4 in pouch exudates. These findings from in vitro and in vivo experiments indicate that both LXA(4) and ATL are regulators of TNF alpha-directed neutrophil actions and stimulate IL-4 in exudates and thus regulate mediators that are held to play an important role in the pathogenesis of periodontal disease.
- L49 ANSWER 48 OF 94 MEDLINE on STN DUPLICATE 12  
AB Bovine lactoferrin was applied topically to the oral mucosa of Syrian hamsters and assessed for its ability to decrease the severity of chemotherapy-induced oral mucositis. Results indicated that the chemotherapy agent 5-fluorouracil (5-FU) administered to hamsters on days 0 and 2 produced severe leukopenia between days 4 and 7 of the trial, and that severity of oral mucositis coincided with the suppressed immune state in these animals. Bovine lactoferrin applied continuously to oral wounds in hamsters induced by a combination of chemotherapy treatment and mild abrasion of the cheek pouch, failed to decrease the severity of mouth ulcers relative to a group receiving BSA as a control protein source. Hamster cheek pouches treated twice daily with lactoferrin had a significantly worse condition score between days 6 and 8, and days 12 and 13 ( $p < 0.05$  to  $p < 0.001$ ), a higher ulcer score between days 6 and 15 ( $p < 0.05$  to  $p < 0.001$ ) and larger ulcer area between days 7 and 14 ( $p < 0.05$  to  $p < 0.001$ ) compared to animals administered the control protein. Body weight changes between treatment and control groups showed no significant difference over the trial period. In contrast to the pre-study hypothesis, we report a detrimental effect from topical administration of bovine lactoferrin to the wounded oral mucosa of immunocompromised hamsters.

L49 ANSWER 50 OF 94 MEDLINE on STN

AB Following oral surgery, there are sometimes disturbances in wound healing. It was the aim of this investigation to look for relationships between the composition of saliva and disturbed wound healing. Resting as well as stimulated fasting whole saliva was collected from 96 patients (19 to 53 years of age) prior to oral surgery. Flow rate, pH, standard bicarbonate, total buffer bases, peroxidase, lysozyme, thiocyanate, secretory immunoglobulin A, lactoferrin, total protein, tissue type plasminogen activator, and plasminogen activator inhibitor were determined. The salivary data of eight patients who suffered from disturbed wound healing were compared to the data of 20 randomly selected patients with normal wound healing. Patients with disturbed wound healing revealed increased activities and secretion rates for peroxidase in resting saliva. In stimulated saliva, decreased secretion rates for thiocyanate and total protein were found. Not a single salivary factor was able to discriminate both groups of patients with sufficient accuracy, but with a combination of tissue type plasminogen activator, peroxidase, plus secretory immunoglobulin A measurements from resting whole saliva a clearly improved and acceptable discrimination of the two patient groups was possible. A discriminant function including six salivary factors could be used to completely separate both groups.

AB Antimicrobial peptides are part of the host defense systems of plants, insects, fish, amphibia, birds, and mammals. These small proteins were previously thought of as an evolutionarily ancient system of immune protection with little relevance to the normal function of human skin. Recent developments have found that mammalian skin expresses these gene-encoded peptide antibiotics during inflammatory events such as wound repair, contact dermatitis, and psoriasis. The presence of these peptides in the skin forms a barrier for innate host protection against microbial pathogenesis. Furthermore, antimicrobial peptides also act on animal cells by stimulating them to change behaviors such as syndecan expression, chemotaxis, and chloride secretion. The combination of effects on host cells with antimicrobial action in a single molecule represents an efficient defense and response system against injury. Understanding the action of antimicrobial peptides in skin may yield further insight into the mechanism of innate cutaneous disease control and provide new approaches to therapy of wounds and inflammatory dermatitis.

L49 ANSWER 69 OF 94 MEDLINE on STN DUPLICATE 20

AB The effects of lactoferrin (Lf), an iron-binding glycoprotein, on cell migration were investigated. Lf inhibited the cell migration of three gastrointestinal cell lines (Caco-2 cells, AGS cells, and IEC-18 cells) in vitro. Both iron-saturated (holo) and iron-depleted (apo) Lf showed this inhibitory effect. Chelation of iron in the culture medium by desferrioxamine did not affect the activity of either form of Lf. A pepsin hydrolysate of Lf exhibited effectiveness similar to that of intact Lf. These results demonstrate a novel activity of Lf and suggest a potential role for this molecule in gastrointestinal wound healing, which is independent of its iron-binding capacity.

L49 ANSWER 72 OF 94 HCAPLUS COPYRIGHT 2009 ACS on STN DUPLICATE 21

AB Pharmaceutical compns. for wound healing contain peptides (lactoferrin hydrolyzate) such as Phe-Gln-Trp-Gln-Arg-Asn or their pharmaceutically acceptable derivs. or salts as active ingredients. The peptides can be synthesized or obtained by enzymic hydrolysis of bovine lactoferrin. Tablets were

formulated containing Phe-Gln-Trp-Gln-Arg-Asn 10.0, lactose monohydrate 30.0, corn starch 19.8, crystalline cellulose 28.0, magnesium silicate pentahydrate 2.0, and magnesium stearate 0.2 mg.

L49 ANSWER 78 OF 94 SCISEARCH COPYRIGHT (c) 2009 The Thomson Corporation on STN

AB The inflammatory phase in wound healing is considered to be a preparatory process for the formation of new tissue. A monocyte-derived cytokine, tumor necrosis factor-alpha (TNF-alpha), is a highly conserved molecule known to play a major role in the pathogenesis of gram-negative shock. Besides this, previous experimental studies show that TNF-alpha may have either a beneficial or detrimental role in wound healing.

The purpose of the present study was to examine the effects of TNF-alpha on developing granulation tissue in rats as well as on rat and human granulation tissue cells in culture. Subcutaneously implanted cylindrical hollow sponges were used for studying the effects of locally applied TNF-alpha on granulation tissue in rats. These implants were treated either on the day of implantation or for the first 4 or 7 days after implantation with a solution containing various amounts of TNF-alpha while the control implants were treated correspondingly with the carrier solution only. The analyses of the granulation tissue were carried out 4, 7, 14 and 21 days after implantation. In the histological specimen these sponges were cut into small pieces and stained with Weigert van Gieson to visualize collagen. The amount of granulation tissue grown into the sponge was calculated from the cross section of every sponge.

For the cell culture studies fibroblasts were released from human and rat granulation tissue which was cut into small pieces and digested by collagenase and DNase in Hank's balanced salt solution. The cells were exposed to 1, 10, or 100 ng/ml of TNF-alpha and the rate of collagen synthesis was measured as synthesis of protein-bound H-3-hydroxyproline. The number of cells in the culture dishes was counted with Burger's hemocytometer after detaching the cells with trypsin treatment. As interleukin-1 (IL-1) and TNF-alpha overlap in many of their functions, the effects of lipopolysaccharide (LPS), human interleukin 1 beta (IL-1) and prostaglandin E(2) (PGE(2)) on experimental granulation tissue in rats as well as on rat granulation tissue cells in culture were studied with the same method.

After a single application of TNF-alpha into the sponge, no essential differences between the groups were detected. However, after daily applications of TNF-alpha for 4 days, an inhibitory effect on tissue repair was observed after 4 and 7 days. Collagen formation, indicated by the hydroxyproline content of the sponge, was significantly lower in the group treated with TNF-alpha than in the controls. This effect was not observed after 14 or 21 days. These findings were confirmed in the histological samples. In the cultures of rat granulation tissue fibroblasts TNF-alpha decreased H-3-hydroxyproline production to about 75% of that in the controls and it had also a decreasing effect on pro alpha 1(I) and pro alpha 1(III) collagen mRNA levels maximally by 67% and 77% of the control level, respectively. In the cultures of human granulation tissue fibroblasts a similar inhibiting effect on the production of collagen was seen. TNF-alpha decreased the production of H-3-hydroxyproline to 56% of the control value with a dose of 100 ng/ml. Similarly, IL-1 beta decreased hydroxyproline content of granulation tissue seven days postoperatively and PGE(2) decreased nonsignificantly the amounts of hydroxyproline but the steady-state levels of pro alpha 1(I) and pro alpha 1(III) collagen chain mRNAs were slightly elevated. In the IL-1 beta-treated fibroblast cultures collagen production decreased by 15% compared with that of the controls. PGE(2) decreased collagen production by 34% of that in the controls. This effect could be abolished with indomethacin. Indomethacin alone stimulated collagen production by 40%. In vivo IL-1 decreases the formation of normal granulation tissue.

This effect may be partly due to IL-1 stimulated secretion of PGE(2).

It is concluded that TNF-alpha inhibits the formation of new granulation tissue by decreasing the production of collagen in vivo in rat granulation tissue and in both human and rat granulation tissue fibroblast cultures. Thus, TNF-alpha may have a role in preventing hypertrophic scar formation.
